

EXPERIMENT 30:

Demonstrate Storage as a Service (SaaS) create and configure a new VM Image in any Public Cloud Service Provider.

Aim

To create and configure a **custom Virtual Machine (VM) Image** using **Microsoft Azure** and demonstrate cloud-based storage and management of a VM image.

Procedure

1. Log in to the **Microsoft Azure Portal** using a valid Azure account.
2. Create a **Resource Group** to organize the resources used for the experiment.
3. Create and configure a **Virtual Machine** in Azure with the required operating system and basic settings.
4. Stop and deallocate the virtual machine before capturing it as an image.
5. Select the **Capture** option from the VM configuration page to create a custom VM image.
6. Create an **Azure Compute Gallery** to store and manage the custom VM image.
7. Create a suitable **VM Image Definition** and select the required operating system state.
8. Specify the image version as **1.0.0** and configure the required image settings.
9. Review the configuration and create the custom VM image.
10. Open the **Azure Compute Gallery** and verify that the image definition and image version have been created successfully.
11. Use the created image to deploy a new virtual machine and verify that the custom image can be reused for VM deployment.

IMPLEMENTATION:

The screenshot displays the Azure portal interface for a deployment named "Microsoft.Compute-CaptureVM-20260901110504". The deployment is currently in progress. The left sidebar shows navigation options: Overview, Inputs, Outputs, and Template. The main content area shows deployment details, including the deployment name, subscription (Azure for Students), resource group (Udacity-Practical-RG), start time (1/9/2026, 11:09:43 am), and correlation ID. A table lists the resources created, showing the "ImageGallery" resource of type "Azure compute gallery" with a status of "Created". The right sidebar contains links to Microsoft Defender for Cloud, free Microsoft tutorials, and an option to work with an expert.

Result:

Thus, a custom VM Image was successfully created and configured in Microsoft Azure using Azure Compute Gallery. The image was stored and managed in the cloud and was successfully used for creating a new virtual machine, demonstrating cloud-based VM image management.
